Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5

10 20 30 40 50

Output: 10 20 30 40 50

Answer

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```
struct node{  
    int id;  
    struct node* next, *prev;  
};
```

```
struct node* head=NULL;
```

```
void insert(int e){  
    struct node* newnode=(struct node*)malloc(sizeof(node));  
    newnode->id=e;  
    newnode->next=NULL;  
    newnode->prev=NULL;  
    struct node* temp=head;  
    if(head==NULL){  
        head=newnode;  
    }  
    else{  
        while(temp->next!=NULL){  
            temp=temp->next;  
        }  
        newnode->prev=temp;
```

```
        temp->next=newnode;
    }
}

void display(){
    struct node* temp=head;
    while(temp!=NULL){
        printf("%d ",temp->id);
        temp=temp->next;
    }
}
```

```
int main(){
    int n;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        int e;
        scanf("%d",&e);
        insert(e);
    }
    display();
}
```

Status : Correct
